

Position summary:

As a member of the global Businesses Platform and Services engineering team, the QE/DEV engineer will be responsible for ensuring the quality level of a number of applications. The candidate will be expected to understand the end-user requirements, work with engineering to develop and define test plans, build and execute test cases and report bugs and bug trends. Ability to forensically triage issues is a must.

The successful candidate will be a key and core contributing member of the team, communication, teamwork and productivity are essential.

Responsibilities:

- The successful candidate must have hands-on testing experience of desktop applications
- The successful candidate must have hands-on testing experience of testing user experience workflows
- The successful candidate must have excellent knowledge on Testing Methodologies & defect Management systems
- The successful candidate will need to work closely with other teams across the company to correctly identify the team best placed to address particular issues
- The successful candidate will be responsible for collaborating with other engineers and project stakeholders to identify when technology is ready for users
- The successful candidate will be responsible for functional, integration, end to end and system testing the technologies using appropriate tools. They will work closely with the Engineering team to validate their testing, and with other stakeholders to identify, investigate, troubleshoot, and address issues
- A keen desire to continue to learn and hone your skills

Requirements:

- Knowledge of Database technologies
- Good object-oriented analysis and design skills.
- Good, working knowledge of one or more development/scripting languages (Java, NodeJS, Python, Ruby etc)
- Experience on testing web services (SOAP/REST) is an advantage.
- Experience of designing test plans and test cases and executing the test runs for large desktop applications
- An understanding of how QE can positively encourage the development of applications with security a top implicit requirement

- Excellent in communication skills & a good team player.
- Quality Certifications would be advantage.
- Knowledge of validating, and troubleshooting XML schema's
- Experience with Test management tools and defect tracking tools
- Knowledge of SOA, J2EE, Web Services (SOAP/REST) would be an added advantage, along with knowledge of network analysis tools such as Charles or Wireshark
